

LAB REPORT

11th May 2025

Defeating Anti-Forensics

Name : Sarthak Das

Session : 11th February – 22nd April 2025

For the class of Computer Forensic, taught by

Drabanti Boral

Contents

1	Introduction	2
1.1	Objectives	2
1.2	System Information	2
1.3	Software Used	2
2	Objective 1: Steganalysis	3
3	Objective 2: Password Recovery	5

2 Objective 1: Steganalysis

Before beginning the practical, we must prepare an image with a hidden text. In order to do this, we open QuickStego, and select **Open Image** and choose the image to open. This supports JPG, JPEG, BMP and GIFF formats.

Next, we enter the text we wish to hide in our image and click Hide Text. Our text is now hidden in the image, as notification shows.

Now, we click on **Save Image** to save it. The image is saved as a BMP file.

In order to perform steganalysis on this image, we can now open this image in QuickStego, and the text of the image shows up on the screen.

3 Objective 2: Password Recovery

For the purposes of this lab, we were provided four files – a Microsoft Word document, a PDF document, a RAR archive and a Microsoft Excel spreadsheet – all of them password protected. We begin by opening Passware Kit and clicking on **Browse for File**, choosing the file we wish to crack the password of.

Once, we have chosen the file, we can now click on **Recover**.

The password recovery is in progress. Without any additional information, it resorts to brute force attack which takes time.

As we can see, this is a demo version, with time limits. Therefore, the passwords could not be found on time. However, in the paid versions this can be easily done.
