1 Introduction

1.1 Objectives

This report is a documentation of my lab work on artifact checking in Windows and Linux. The primary objective of this lab is to check digital artifacts in Windows and Linux.

1.2 System Information

For the purposes of this lab, a Lenovo ThinkPad X270 was used, having the following system specifications: Intel Core i7-7600U CPU @ 2.80GHz with Intel UHD Graphics 620, 16GB RAM, 1TB SSD running operating system Windows 11 23H2 (Build 22631).

```
PS C:\Users\Sarthak Das> neofetch.exe

Sarhak Das@DESKTOP-140NOFV
OS: Windows 11
Build: 23H2 (22631)
Uptime: 0 days, 0 hours, 37 minutes
Resolution: 1920x1080 @60Hz
Terminal: PowerShell 7 (x64)
CPU: Intel(R) Core(TM) i7-7600U CPU @ 2.8
GHz
GPU: Intel(R) UHD Graphics 620
Memory: 5808 MB / 16264 MB (35% in use)
Disk: C:\ 365.95 GB (86.8 GB free)

Mem%:  --[ //////////////// ]--
Disk%:  --[ //////////////// ]--
```

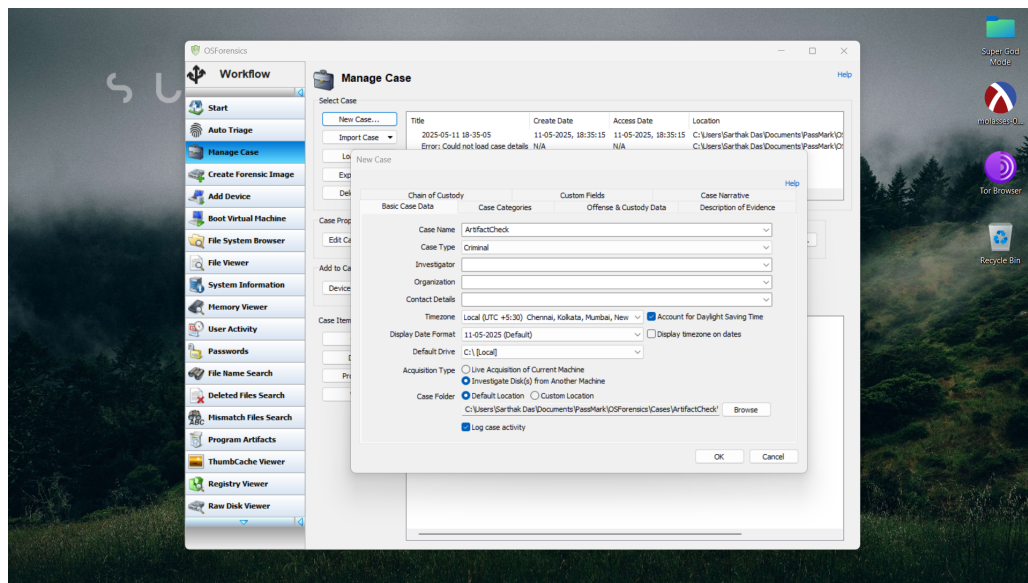

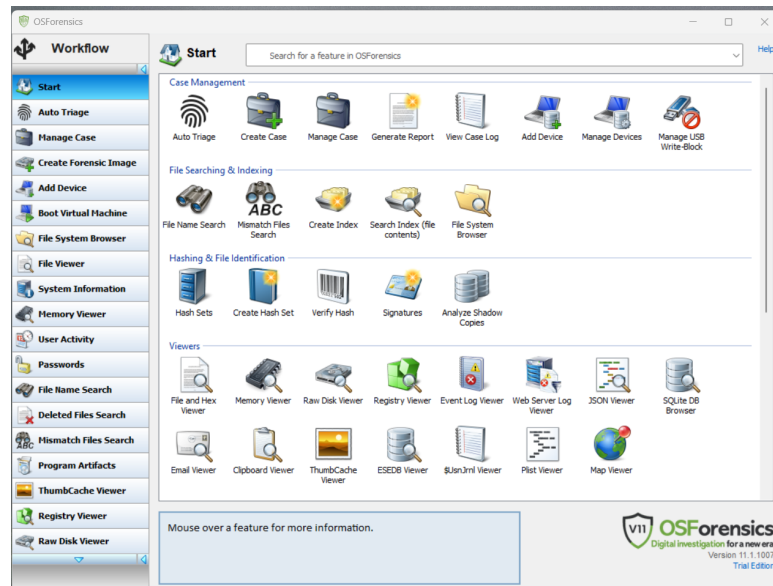

1.3 Software Used

The software used for this practical is OSForensics Version 11.1.1007 Trial Edition.

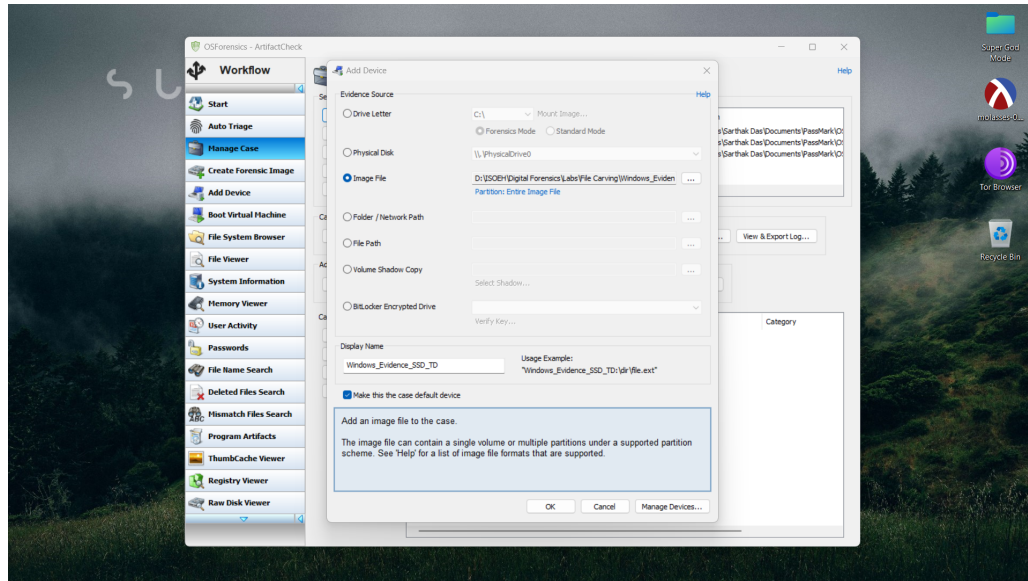

2 Objective: Artifact Checking

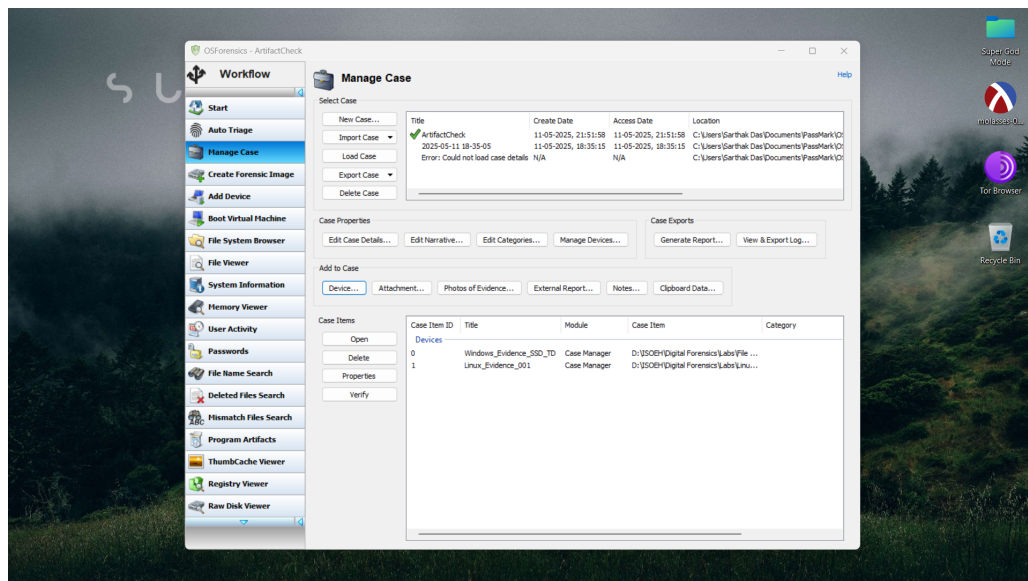

We begin by opening OSForensics, and selecting **Create Case** and set the case name to **ArtifactCheck**.

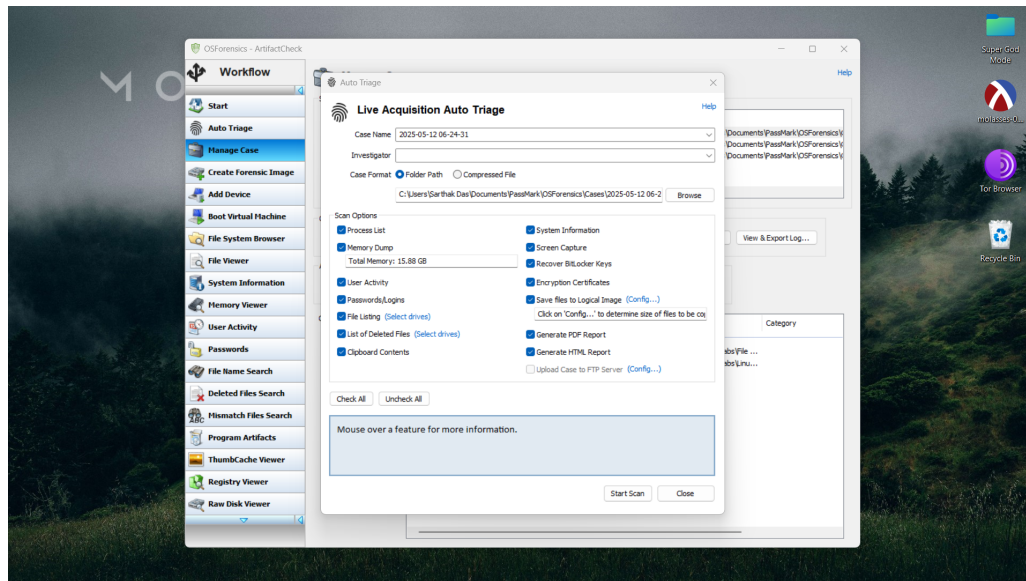

Next, we are prompted to add a device. For the purposes of this lab, we were provided with one Windows disk image and one Linux disk image. We add both devices to our case.

Now we can check the artifacts in both these disk images by going to **Auto Triage**.

In Auto Triage, we are prompted to select the components to scan. Auto Triage will scan for the artifacts we select, and automatically generate an HTML/PDF report for us.

In my PC, I was unable to get Auto Triage running due to (presumably) memory issues – which resulted in my system going to a blue screen of death upon clicking on **Start Scan**.
